

Copilot

Sure, I can help you set up SSH Key Authentication on your iMac. Here are the steps:

1. Open Terminal:

- You can find Terminal in the Applications > Utilities folder, or you can use Spotlight to search for it.

2. Generate SSH Key Pair:

- In the Terminal, type the following command and press Enter:

```
ssh-keygen -t rsa -b 4096 -C "your_email@example.com"
```
- This command generates a new SSH key using the RSA algorithm with a 4096-bit key length. Replace "your_email@example.com" with your email address.
- When prompted to "Enter a file in which to save the key," press Enter to accept the default file location.
- Next, you'll be asked to enter a passphrase. This is optional but recommended for added security.

3. Add SSH Key to the SSH Agent:

- Start the SSH agent in the background by running:

```
eval "$(ssh-agent -s)"
```
- Add your SSH private key to the SSH agent:

```
ssh-add -K ~/.ssh/id_rsa
```

4. Add SSH Key to Your GitHub Account:

- Copy the SSH key to your clipboard:

```
pbcopy < ~/.ssh/id_rsa.pub
```
- Go to GitHub and log in to your account.
- Navigate to **Settings** > **SSH and GPG keys** > **New SSH key**.
- Paste your SSH key into the "Key" field and give it a title.

5. Update Your Git Remote URL:

- Change the remote URL of your repository to use SSH:

```
git remote set-url origin git@github.com:username/repository.git
```
- Replace username with your GitHub username and repository with the name of your repository.

After completing these steps, you should be able to push to your GitHub repository without

being prompted for your username and password.

Let me know if you run into any issues or need further assistance!
